gen**

PT-141, or Bremelanotide, is a peptide therapy that targets the brain's arousal centers to treat sexual dysfunction. Unlike traditional ED drugs, it works through melanocortin receptors in the CNS, enhancing libido and arousal in both men and women.

FDA-approved for HSDD in women, it's also used off-label in men to boost sexual desire and spontaneity. PT-141 acts quickly, typically within 30–60 minutes, with effects lasting 6–12 hours. Its brain-based mechanism offers a powerful alternative for those unresponsive to vascular-focused treatments.

## Key Potential Benefits

- **Boosts Sexual Desire** – Significantly improves sexual desire scores in premenopausal women (HSDD) using as-needed dosing.
- **Enhances Arousal & Erectile Function in Men** – Rapid, dose-dependent improvements in erectile performance were observed in both healthy individuals and men with mild-to-moderate ED.
- **Works Without PDE-5 Inhibitors** – Acts centrally (MC3/4 receptors), so may help men who don't respond to treatments like Viagra or Cialis.
- **Short-Acting, On-Demand Use** – Typically effective within 30–60 min, making it flexible for clinical and home-use protocols.
- **Well-Tolerated** – Common side effects include transient nausea, flushing, and headache, generally mild and manageable.

### Technical Information:

**CAS Number:** 189691-06-3

**PubChem CID:** [9941379](#)

**Formula:** C50H68N14O10

### Specifications:

- 0.05mg per click.
- Up to 60 clicks per dose.
- Includes 4 needles and one adjustable dosage pre-mixed pen.
